ABSTRACT OF THE DISCLOSURE

Systems and techniques to provide data in a generalized data format. In a commercial transaction environment, a generalized data handler may access business object data. The business object data may include attribute data for one or more attributes of a desired commercial transaction. The generalized data handler may retrieve metadata from the business object data, and may construct a generalized data structure for the attribute data using the metadata. The generalized data handler may parse the attribute data into the generalized data structure, which may then be exported to an external application.
